## GENERAL/REALIGNMENT

### INTRODUCTION

#### SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

#### ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

### REALIGNMENT

#### 1 Modes

MODE	FUNCTION
User Mode	Use this mode for normal operation.
PC Mode	Use this mode, to make various settings by means of the FPU through the RS-232C port.
Manufacture Mode	Use this mode, to realign the various settings through the RS-232C port during manufacture work.

#### 2 How to enter each mode

MODE	PROCEDURE
User Mode	Power ON
PC Mode	Connect to the IBM PC compatible machine and controlled by the FPU.

### PERSONAL SAFETY

The following precautions are recommended for personal safety :

- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

### SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

Destnation	Number of CH	RF power output
M3	16	5W

### 3 Getting acquainted

#### ① PTT (Push-To-Talk) switch

Press this switch, then speak into the microphone to call a station. Release the switch to receive.

#### ② Monitor key

Press and hold to monitor how busy the current channel is and to monitor signals being received that do not contain the matched QT/DQT code.

#### ③ Channel selector

Rotate to select channels 1 ~ 16.

#### ④ LED indicator

Lights red while transmitting, green while receiving a signal. Flashes red when the battery voltage is low while transmitting.

#### ⑤ Power switch/ Volume control

Turn clockwise to switch the transceiver ON. Turn counterclockwise until a click sounds, to switch the transceiver OFF. Rotate to adjust the volume level.

# REALIGNMENT

## PC MODE

### Preface

The transceiver is programmed by using a personal computer, programming interface (KPG-22) and programming software (KPG-55D).

The programming software can be used with an IBM PC or compatible. Figure 1 shows the setup of an IBM PC for programming.

### Connenction procedure

1. Connect the TK-2107 to the personal computer with the interface cable.
2. When data is transmitting from the transceiver the red LED lights.  
When data is receiving by the transceiver the green LED lights.

### Notes:

- The data stored in the personal computer must match the Model Name when it is written into the EEPROM.
- Do not press the [PTT] key during data transmission or reception.

### • KPG-22 description

(PC programming interface cable: Option)

The KPG-22 is required to interface the TK-2107 with the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level. The KPG-22 connects the side panel jacks of the TK-2107 to the computer's RS-232C serial port.

### • Programming software description

The KPG-55D Programming Disk is supplied in 3-1/2" the disk format. The Software on this disk allows a user to program TK-2107 radios via a Programming interface cable (KPG-22).

### • Programming with IBM PC

If data is transferred to the transceiver from an IBM PC with the KPG-55D, the destination data (basic radio information) for each set can be modified. Normally, it is not necessary to modify the destination data because their values are determined automatically when the frequency range (frequency type) is set.

The values should be modified only if necessary.

Data can be programmed into the EEPROM in RS-232C format via the SP MIC plug.

In this mode the PTT line operates as TXD and RXD data lines respectively.

\* M3 type has wide mode only.

All narrow data should be not available, even though data would be modified in test mode.

Fig. 1

## DISASSEMBLY FOR REPAIR

### Separating the case assembly from the chassis

1. Remove the two knobs ① and three round nuts ②.
2. Remove the two screws ③.
3. Expand the right and left sides of the bottom of the case assembly, lift the chassis, and remove it from the case assembly ④.

4. Taking care not to cut the speaker lead ⑤, open the chassis and case assembly.

### Separating the chassis from the unit

1. Remove the eleven screws ⑥.
2. Remove the solder from the antenna terminal using a soldering iron then lift the unit off ⑦.
3. Remove the two screws ⑧ and remove the antenna connector.

**Note :** When reassembling the unit in the chassis, be sure to solder the antenna terminal.

### Removing the lever

1. Raise the lever on the lower case ⑨, insert a small flat screwdriver into the space between the case and lever, open the case carefully ⑩ and lift the lever off.

**Note :** Do not force to separate the case from the lever.

## CIRCUIT DESCRIPTION

### 1. Frequency configuration

The receiver utilizes double conversion. The first IF is 38.85MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Fig. 1 shows the frequencies.

**Fig. 1 Frequency configuration**

### 2. Receiver

The receiver is double conversion superheterodyne, designed to operate in the frequency range of 216 to 223MHz (M3 type).

The frequency configuration is shown in Fig. 1.

#### 1) Front - end RF amplifier

An incoming signal from the antenna is applied to an RF amplifier (Q203) after passing through a transmit/receive switch circuit (D102 and D103 are off) and a band pass filter (L208, L209 and L210). After the signal is amplified (Q203),

the signal is filtered through a band pass filter (L203 and L214) to eliminate unwanted signals before it is passed to the first mixer. (See Fig. 2)

**Fig. 2 Receiver section configuration**

#### 2) First Mixer

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q202) to create a 38.85MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through two monolithic crystal filters (MCFs : XF200) to further remove spurious signals.

#### 3) IF amplifier

The first IF signal is amplified by Q201, and then enters IC200 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC200 to create a 450kHz second IF signal. The second IF signal is then fed through a 450kHz ceramic filter (CF200) to further eliminate unwanted signals before it is amplified and FM detected in IC200.

#### 4) AF amplifier

The recovered AF signal obtained from IC200 is amplified by IC300 (1/4), filtered by the IC300 low-pass filter (2/4) and IC300 high-pass filter (3/4) and (4/4), and de-emphasized by R303 and C306. The processed AF signal passes through an AF volume control and is amplified to a sufficient level to drive a loud speaker by an AF power amplifier (IC302).

# TK-2107

## CIRCUIT DESCRIPTION

XF200:L71-0535-05

Item	Rating
Nominal center frequency	38.850MHz
Pass band width	$\pm 7.5\text{kHz}$ or more at 3dB
40dB stop band width	$\pm 40.0\text{kHz}$ or less
Ripple	1.0dB or less
Insertion loss	3.0dB or less
Guaranteed attenuation	80dB or more at $f_0 - 1000\text{kHz}$
Terminal impedance	$1200\Omega / 1.4\text{PF}$

CF200:L72-0979-05

Item	Rating
Nominal center frequency	450kHz
6dB band width	$\pm 7.5\text{kHz}$ or more
50dB band width	$\pm 15\text{kHz}$ or less
Ripple	2.0dB or less at $f_0 \pm 5\text{kHz}$
Insertion loss	6.0dB or less
Guaranteed attenuation	35.0dB or more at $f_0 \pm 100\text{kHz}$
Terminal impedance	$1.5\text{k}\Omega$

### 5) Squelch

Part of the AF signal from the IC enters the FM IC again, and the noise component is amplified and rectified by a filter and an amplifier to produce a DC voltage corresponding to the noise level.

The DC signal from the FM IC goes to the analog port of the microprocessor (IC403). IC403 determines whether to output

sounds from the speaker by checking whether the input voltage is higher or lower than the preset value.

To output sounds from the speaker, IC403 sends a high signal to the MUTE and AFCO lines and turns IC302 on through Q302, Q304, Q305, Q306 and Q307.(See Fig. 3)

Fig. 3 AF Amplifier and squelch

### 6) Receive signaling

QT/DQT

300 Hz and higher audio frequencies of the output signal from IF IC are cut by a low-pass filter (IC301). The resulting signal enters the microprocessor (IC403). IC403 determines whether the QT or DQT matches the preset value, and controls the MUTE and AFCO and the speaker output sounds according to the squelch results.

### 3. PLL frequency synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

#### 1) PLL

The frequency step of the PLL circuit is 5 or 6.25kHz. A 12.8MHz reference oscillator signal is divided at IC1 by a fixed counter to produce the 5 or 6.25kHz reference frequency. The voltage controlled oscillator (VCO) output signal is buffer amplified by Q6, then divided in IC1 by a dual-module programmable counter . The divided signal is compared in phase with the 5 or 6.25kHz reference signal in the phase comparator in IC1. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig.4)

## CIRCUIT DESCRIPTION

### 2) VCO

The operating frequency is generated by Q4 in transmit mode and Q3 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D2 and D4 in transmit mode and D1 and D3 in receive mode). The T/R pin is

set high in receive mode causing Q5 and Q7 to turn Q4 off, and turn Q3 on. The T/R pin is set low in transmit mode. The outputs from Q3 and Q4 are amplified by Q6 and sent to the buffer amplifiers.

Fig. 4 PLL circuit

### 3) UNLOCK DETECTOR

If a pulse signal appears at the LD pin of IC1, an unlock condition occurs, and the DC voltage obtained from D7, R6, and C1 causes the voltage applied to the UL pin of the microprocessor to go low. When the microprocessor detects this condition, the transmitter is disabled, ignoring the push-to-talk switch input signal. (See Fig. 5)

Fig. 5 Unlock detector circuit

## 4. Transmitter

### 1) Transmit audio

The modulation signal from the microphone is amplified by IC500 (1/2), passes through a preemphasis circuit, and amplified by the other IC500 (1/2) to perform IDC operation. The signal then passes through a low-pass filter (splatter filter) (Q501 and Q502) and cuts 3kHz and higher frequencies. The resulting signal goes to the VCO through the VCO modulation terminal for direct FM modulation. (See Fig. 6)

### 2) QT/DQT encoder

A necessary signal for QT/DQT encoding is generated by IC403 and FM-modulated to the PLL reference signal. Since the reference OSC does not modulate the loop characteristic frequency or higher, modulation is performed at the VCO side by adjusting the balance. (See Fig. 6)

Fig. 6 Transmit audio QT/DQT

# TK-2107

## CIRCUIT DESCRIPTION

### 3) VCO and RF amplifier

The transmit signal obtained from the VCO buffer amplifier Q100, is amplified by Q101. This amplified signal is passed to the power amplifier, Q102 and Q105, which consists of a 2-stage FET amplifier and is capable of producing up to 5W of RF power. (See Fig.7)

### 4) ANT switch and LPF

The RF amplifier output signal is passed through a low-pass filter network and a transmit/receive switching circuit before it is passed to the antenna terminal. The transmit/receive switching circuit is comprised of D101, D102 and D103. D102 and D103 turned on (conductive) in transmit mode and off (isolated) in receive mode.

Fig. 7 APC system

### 5) APC

The automatic power control (APC) circuit stabilizes the transmitter output power at a predetermined level by sensing the drain current of the final amplifier Field Effect Transistor (FET) . The voltage comparator, IC100 (2/2), compares the voltage obtained from the above drain current with a reference voltage which is set using the microprocessor. An APC voltage proportional to the difference between the sensed voltage and the reference voltage appears at the output of IC100 (1/2). This output voltage controls the gate of the FET power amplifier, which keeps the transmitter output power constant. The transmitter output power can be varied by the microprocessor which in turn changes the reference voltage and hence, the output power.

### 6) Terminal protection circuit

When the thermistor (TH100) reaches about 80°C, the protection circuit turns on Q107 to protect transmitting final amplifier (Q105) from the over heating.

### 5. Power supply

A 5V reference power supply [5M] for the control circuit is derived from an internal battery. This reference is used to provide a 5V supply in transmit mode [5T], a 5V supply in receive mode [5R], and a 5V supply common in both modes [5C] based on the control signal sent from the microprocessor.

### 6. Control system

The IC403 CPU operates at 7.37MHz . This oscillator has a circuit that shifts the frequency according to the EEPROM data.

## PACKING

# ADJUSTMENT

## Required Test Equipment

### 1. Stabilized Power supply

1. The supply voltage can be changed between 5V and 18V, and the current is 3A or more.
2. The standard voltage is 7.5V.

### 2. DC Ammeter

1. Class 1 ammeter (17 ranges and other features).
2. The full scale can be set to either 300mA or 3A.
3. A cable of less internal loss must be used.

### 3. Frequency Counter (f. counter)

1. Frequencies of up to 1GHz or so can be measured.
2. The sensitivity can be changed to 500MHz or below, and measurements are highly stable and accurate (0.2ppm or so).

### 4. Power Meter

1. Measurable frequency : Up to 500MHz
2. Impedance :  $50\Omega$ , unbalanced
3. Measuring range : Full scale of 10W or so
4. A standard cable (5D2W 1m) must be used.

### 5. RF Voltmeter(RF V.M)

1. Measurable frequency : Up to 500MHz or so.

### 6. Linear Detector

1. Measurable frequency : Up to 500MHz or so
2. Characteristics are flat, and CN is 60dB or more.

### 7. Digital Voltmeter

1. Voltage range : FS=18V or so
2. Input resistance :  $1M\Omega$  or more

### 8. Oscilloscope

1. Measuring range : DC to 30MHz
2. Provides highly accurate measurements for 5 to 25MHz.

### 9. AF Voltmeter (AF V.M)

1. Measurable frequency : 50Hz to 1MHz
2. Maximum sensitivity : 1mV or more

### 10. Spectrum Analyzer

1. Measuring range : DC to 1GHz or more

### 11. Standard Signal Generator (SSG)

1. Maximum frequency : 500MHz or more
2. Output : -133dBm/0.05μV to 7dBm/501mV
3. Output impedance :  $50\Omega$

### 12. Tracking Generator

1. Center frequency : 50kHz to 500MHz
2. Frequency deviation :  $\pm 35\text{MHz}$
3. Output voltage : 100mV or more

### 13. Dummy Load

1.  $8\Omega$ , 3W or more

### 14. AF Generator(AG)

1. Frequency range : 100Hz to 100kHz
2. Output : 0.5mV to 1V

### 15. Distortion Meter

1. Measurable frequency : 30Hz to 100kHz
2. Input level : 50mV to 10Vrms

- Use a non-conductive rod such as a Ceramic rod for adjustment (especially of trimmers and coils).
  - Kenwood order No. A-0910 (0.4X0.9mm)
  - Kenwood order No. A-1310 (0.4X1.3mm)
- To protect the SSG, do not send out signals while adjusting the receiving unit.
- The indicated SSG output levels are for maximum output.

# TK-2107

## ADJUSTMENT

### Adjustment point

- TC201: Band-pass filter waveform adjustment
- L212: AF level adjustment
- TC1: Transmit lock voltage adjustment
- TC2: Receive lock voltage adjustment
- TP2: Band-pass filter test point

- ANT: Antenna connector
- CH: Channel selector
- SP: Speaker jack
- MIC: Microphone jack
- CV: Lock voltage adjustment terminal
- VR500: DQT waveform adjustment
- VR501: DEV adjustment

**Note :** To fine tune the frequency when not using a computer, adjust VR1.

### ADJUSTMENT FREQUENCY LIST

M3		
CH	TX f (MHz)	RX f (MHz)
Center		220.00
Low		216.05
Hi		222.95

### Remarks

- Connect the transceiver to the PC
- Send the channel data to the transceiver, then backup the data.
- Program the adjustment frequencies which are in the list, into the transciever.

**Note :** Remember to reload the channel data you backed up after making the adjustments.

### 1. Jig (chassis) for adjustment (part number A10-1392-03)

#### 2. Use the jig as follows:

1. Insert the coaxial antenna connector into the jig.
2. Place the unit on the jig and fix it with 12 screws. ①
3. Solder the antenna terminal to the terminal of the unit.

**Notes:** Supply power from an external power supply.

( Relay terminal: + )  
jig (chassis) : -

## ADJUSTMENT

Use the KPG-55D programming software for adjustment of the next item in PC MODE (see page 3).

### Squelch Level, Transmit frequency, DQT Balance, RF Power, QT Deviation, DQT Deviation, Battery Level Section common to the transmitter and receiver (VCO)

Item	Condition	Measurement		Adjustment		Specifications/ Remarks
		Test equipment	Terminal	Parts	Method	
1. Setting	1) Power supply voltage Battery terminal: 7.5V					
2. VCO lock voltage	1) CH: TX high	Digital voltmeter	CV	TC1	3.8V	±0.1V
	2) CH: RX high			TC2	3.8V	±0.1V
	3) CH: TX low				Check	more than 0.7V
	4) CH: RX low					

### Receiver Section

Item	Condition	Measurement		Adjustment		Specifications/ Remarks
		Test equipment	Terminal	Parts	Method	
1. Band-pass filter	1) CH: RX center 2) Tra generator output -40dBm Connect the spectrum analyzer to TP2 terminal.	Tra generator Spectrum analyzer	ANT TP2	TC201	Adjust the frequency so that it becomes the spectrum waveform shown in Fig.1.	
2. AF level	1) CH: RX center SSG output: -53dBm (501μV) MOD: 1kHz DEV: ±3.0kHz (Wide)	SSG Oscilloscope AF. V. M Distortion meter	ANT SP	L212	Adjust to the MAX AF level	
	3. Sensitivity				Check	SINAD: 12dB or higher
4. Squelch Level (PC MODE)	1) CH: RX center MONI: ON		PC key	Level 9 Adjust to close the squelch.	The squelch must be closed.	
	2) Level 9 SSG output: -117dBm (0.32μV)					
	3) Level 3 SSG output: -125dBm(0.126μV)			Level 3 Adjust to close the squelch.	The squelch must be closed.	

### Transmitter section

Item	Condition	Measurement		Adjustment		Specifications/ Remarks
		Test equipment	Terminal	Parts	Method	
1. Transmit frequency (PC MODE)	1) CH: TX center PTT: ON	Frequency counter	ANT	PC key	Adjust to center frequency	within ± 100Hz
2. DQT/QT Balance (PC MODE)	1) CH: TX center	Modulation analyzer or linear detector (LPF: 3kHz) Oscilloscope	VR500	Rectify the waveform to square wave		
					Adjust it to 4.8W	
3. Power (PC MODE)	1) CH:TX center Battery terminal: 7.5V PTT: ON	Power meter Ammeter	ANT MIC	VR501	Adjust it to ± 4.2kHz	±100Hz
					Check (+, - Peak whichever is Maximum)	±2.2kHz~3.6kHz: (Wide)
6. QT DEV (PC MODE)	1) CH: TX center QT: 67.0Hz	Modulation analyzer or linear detector (LPF:3kHz) Oscilloscope AG AF. V. M	ANT	PC key	Adjust it to ± 0.75kHz	±50Hz
				PC key	Adjust it to ± 0.75kHz	±50Hz
7. DQT DEV (PC MODE)	1) CH: TX center	Modulation analyzer or linear detector (LPF:3kHz) Oscilloscope	BATT	PC key	Adjust so that the LED flashes.	The LED must flash.

## TK-2107 TK-2107 BLOCK DIAGRAM

## LEVEL DIAGRAM

### RX section

SG output level for obtaining 12dB / SINAD when injected to each point through a 470pF coupling capacitor.  
Measure the 1st Local level on a RF VTVM.

### TX section

Modulate the AF level with a frequency of 1kHz and deviation of 1.5kHz (Narrow), 3kHz (Wide). Then take the signal from the signal generator output when set to -53dBm and obtain the level shown on an AF VTVM when the AF output has been adjusted to 0.63Vrms with the AF vol.

KNB-15A

CIRCUIT DIAGRAM

SPECIFICATIONS

Voltage	: 7.2V (1.2V x 6)
Charging current	: 1100mAh
Dimensions	: 60.8W x 110.8H x 20.3D (mm) (projections included)
Charger and charging time:	KSC-15 (normal charger), approximately 8 hours
Weight	: 210g
