for

FIVE-VALVE DUAL-WAVE

# VIBRATOR-OPERATED BATTERY RECEIVER 

TABLE MODEL 268

CONSOLE MODEL 328
(Incorporating Chassis Type A557DM)

## TECHNICAL SPECIFICATION

## POWER SUPPLY:

6 volt 130 amp . hour Accumulator.

## CONSUMPTION:

1 amp. at 6.0 Volts.
FREQUENCY RANGE:
Broadcast: $540 \mathrm{Kc} / \mathrm{s}$ to $1600 \mathrm{Kc} / \mathrm{s}$.
Short-Wave: 16.5 Metres to 51 Metres.
I.F. FREQUENCY:
$457.5 \mathrm{Kc} / \mathrm{s}$.
VALVE COMPLEMENT:
1C7G Converter
1M5G 1st IF. Amplifier
1K7G 2nd I.F. Amplifier,-Demod.,-AVC
1 K7G A.F. Amplifier
1L5G Power.

DIAL LAMPS (2):
6.3 voits, 0.15 to 0.3 amp .

LOUDSPEAKERS:
Model 268: 6in. Permagnetic
Model 328: 6in. Permagnetic
10 in . Permagnetic
Voice Coil Impedance at 400 c.p.s.
bin. Speaker: 3.7 ohms
10in. Speaker: 2.7 ohms.

| DIMENSIONS: | Width | Height | Depth |
| ---: | :---: | :---: | :---: |
| Model 268: | 19in. | $11 \frac{3}{4} \mathrm{in}$. | $10 \frac{1}{5} \mathrm{in}$. |
| Model 328: | 32in. | $29 \frac{1}{2} \mathrm{in}$. | 12 in. |

WEIGHT:
Model 268
Model 328
Accumulators

| Gross | Net |
| :---: | :---: |
| 36 lbs. | 29 lbs. |
| 71 lbs | 61 lbs. |
| 56 lbs. | 52 lbs. |

## CIRCUIT DESCRIPTION

These models incorporate a 5 -valve vibrator-operated superheterodyne receiver for broadcast and short-wave reception.

## FREQUENCY CHANGER:

The aerial, on the broadcast band, is coupled to the signal frequency circuit by means of the irondust cored aerial transformer L1-L2. For short-wave reception, the short-wave derial transformer L.5-L6 is switched into circuit.

A pentagrid converter is employed as frequency changer. Fixed padding capacitors are used on both wave bands. A variable padding adjustment is provided on the broadcast band by means of an iron-dust bolt in the broadcast oscillator coil L3-L4.

## 1st I.F. AMPLIFIER

The converter valve is transformer coupled to a super-control pentode, V2, which functions as an I.F. amplifier. This valve is in turn transformer coupled to the 2nd I.F. amplifier vaive V3, which is a duo-diode-pentode. The I.F. transformers are of the permeability tuned type with fixed tuning condensers.

2nd I.F. AMPLIFIER,-DEMODULATOR,-AVC
The output of this valve is transformer coupled to the demodulator diode. The remaining diode is capacity coupled to the plate circuit and supplies AVC voitage to the 1st I.F. valve and the broadcast section of the converter. AVC diode delay voltage and also standing bias for this valve is obtained from the voltage drop across the filament of the 1st I.F. valve.

## A.F. AMPLIFIER

The input of this valve may be switched to either the demodulator diode load, R12, or to external pick-up terminals. Tone Control is effected at this stage by means of switch S2, which gives bass or treble cut as required, by switching appropriate condensers. The output circuit of this valve is resistance-capacity coupled to the grid of the power pentode valve $V 5$.

## POWER STAGE

The output of the power valve is coupled to the speaker by transformer T2. Negative feedback voltage is taken from the secondary of the transformer and led into the volume control tap through a resistor. This arrangement provides negative leedback over the whole of the audio feed system. By advancing the volume control setting for higher gain the feedback factor is reduced. A phasing network comprising C33, R18 is connected across the transiormer primary.

In Model 328, two speakers, each having different characteristics, are connected to appropriate taps on the output transformer secondary. This arrangement ensures that the output valve is working into its correct load, and, at the same time, different proportions of power are fed to each speaker.

NOTE: The speakers are connected to the chassis by means of polarised 2 -pin plugs; it is
important that the large and small speakers be plugged into their correct sockets, i.e., "large" and "small," respectively.

When servicing has been carried out on a speaker, it is necessary to make sure that the speaker cones are correctly phased so that both cones move in the same direction, otherwise lack of bass response will be experienced. This may be taken care of by ensuring that the voice coil connections of a serviced speaker are correctly reconnected to the polarised plug.

## HIGH TENSION SUPPLY

High tension voltage is obtained by means of a synchronous vibrator and associated transformer and filters, the whole being incorporated on a subchassis which is shock-mounted on the main receiver chassis. The vibrator cartridge is readily accessible by removing the rubber-lined metal cover enclosing it. The vibrator input circuit is protected by a 10 amp. fuse in the positive side of the circuit. A double-pole single-throw switch - combined with the Volume Control-controls the vibrator and valve filament circuits.

## DISMANTLING

MODEL 268

1. Disconnect battery leads.
2. Remove control knobs.
3. Disconnect dial lamp switch plug from chassis.
4. Unscrew two chassis holding screws.
5. Withdraw chassis.

MODEL 328

1. Disconnect battery leads.
2. Remove control knobs.
3. Disconnect speaker and dial lamp switch plugs from chassis.
4. Unscrew two chassis fixing nuts and withdraw bolts.
5. Withdraw chassis.

## WIRE TO PASS UNDER NUT

 AT REAR OF SCREW

2 COMPLETE TURNS.

## - VOLTAGE TABLE-

-     - VOLTACES AND CURRENTS ARE WITH THE RECEIVER OPERATING WITH BATTERY TERMINAL VOLTACE OF 6.O VOLTS, AND TUNED TO A POINT OF NO RECEPTION ON THE BROADCAST BAND. - - VOLTACE READINGS TAKEN WITH METER RESISTANCE OF 1,000 OHMS PER VOLT.
- VOLTACE AND CURRENT READINCS WITHIN $\pm 15 \%$.
- RESISTANCE READINGS ARE APPROXIMATE.

CIRCUIT DIAGRAM OF MODELS 268 AND 328, INCORPORATING CHASSIS TYPE A557DM.

## RECEIVER ALIGNMENT PROCEDURE

In any case where a component replacement has been made in either the tuned I.F. or R.F. circuits of a receiver, all circuits must be re-aligned, and even if only one coil has been serviced, the whole of the re-alignment should be done in the order given. An output meter should always be connected across the voice coil terminals of the speaker to indicate when the circuits are tuned to resonance. In carrying out the following operations, it is important that the input to the receiver from the signal generator should be kept low and progressively reduced as the circuits are brought into line, so that the output meter reading does not exceed about 0.5 volt.

## I.F. ALIGNMENT

1. Rotate the volume control fully clockwise, set Tone Monitor switch to "Normal," and the wave-change switch to "Broadcast" (centre) position and fully enmesh the tuning condenser vanes. Connect the output leads of signal generator to the cap of the 1C7G converter valve, through a 0.1 mF . condenser; do not remove grid lead of the converter valve.
2. Tune signal generator to exactly 457.5 Kc s.
3. Adjust the I.F. transformer trimmer screws for maximum reading on output meter. commencing with the third I.F. transformer and following with the second and first.
4. Continue this alignment on each transformer in turn until no greater output can be obtained. It is necessary to repeat this procedure twice to ensure good alignment.
NOTE: If trimmer screws are screwed too kar $=$ in, it may be possible to obtain a false peak due to coupling effects between the iron cores. Start alignment of each individual transformer by first screwing its core well out, and then advancing core into the coil until resonance is obtained.

## R.F. ALIGNMENT (BROADCAST)

1. With controls set as for I.F. alignment, connect signal generator output leads in series with a 200 mmF . condenser to the derial and earth terminals of the receiver.
2. Check that when the gang condenser is fully meshed the pointer coincides with the setting line, marked " $S$," on the extreme
right of the dial scale. If necessary, the pointer may be adjusted to this position by loosening the cord securing screw provided.
3. Tune signal generator to $600 \mathrm{Kc} / \mathrm{s}$.
4. Rotate tuning knob until the pointer is exactly over $600 \mathrm{Kc} / \mathrm{s}$ calibration mark and adjust the oscillator padder screw for maximum response.
5. Rotate tuning knob until the pointer coincides with the $1500 \mathrm{Ke} / \mathrm{s}$ calibration mark and adjust the oscillator trimmer and aerial trimmer in turn for maximum response.
6. Repeat operations (3) to (5) inclusive for proper alignment.

## R.F. ALIGNMENT (SHORT-WAVE)

1. Set wave-change switch to "Short-Wave" (clockwise) position. Remove the 200 mmF . condenser from the output lead of the signal generator and replace with a 400 ohm non-inductive resistor; connect to the aerial terminal as before.
2. Rotate tuning knob until the pointer coincides with the 17 metres calibration mark.
3. Tune signal generator to 17 metres (17.65 Mc s.).
4. Adjust S-W oscillator trimmer for maximum output. Two settings will be found at which this trimmer will peak; care must be taken that the setting finally selected is that which gives the lower capacity. Failure to select the correct position of the two will cause serious tracking error and loss of sensitivity.
5. Adjust S-W aerial trimmer for maximum output whilst "rocking" the gang condenser slightly to obtain the true resonance point.
6. Note that the signal is still tuned in correctly on the dial: if not, readjust S-W oscillator trimmer slightly until dial reads correctly, and repeat operation (5).

## ADDITIONAL DATA

Any further service information desired may be obtained by addressing a enquiry to the "Service Department, The Graptitpone Co. Ltd., 2 Parramatta Road, Homebush. N.S.W."
(The Company reserves the right to make any modification without notice).
